

RobbJack grinds the flat, at no charge

Shop-ground flats are a common cause of inconsistent results and tool failure, so RobbJack grinds the set-screw flat at the factory for free. For each tool and holder, give us **A** and **B** in inches. We grind the flat so its corner sits **A + B** from the cutting tip.

A = holder face (tip of the toolholder) to the corner of the set screw's flat tip, where the flat meets the 45° chamfer on the holder-face side (not where the 45° starts). **B** = desired stickout, holder face to cutting tip. Shrink-fit and hydraulic holders need no flat, so write "no flat".
